COMMENTS & RESPONSES: DRAFT 2017 Tillamook County Multi-Jurisdictional Natural Hazards Mitigation Plan

#	COMMENTER	COMMENT	RESPONSE
1	Tom Bender Neahkahnie, OR	What is actual earthquake hazard being considered - what does "M 9.0" mean? Is that the same as R-9? XXL quake is R-9.5, with FIVE TIMES the lateral movement of R9.0. Triple confusion with other two ratings having MM wording!	The earthquake being considered is a Cascadia Su 9.0. The moment magnitude is more accurate for earthquakes that are up to a magnitude 6.5. Magn feel nearby earthquakes of M3.0 or greater. Shaki based on observation and therefore subjective. Ra of five sizes that express the extent of tsunami intu used to depict the tsunami evacuation zone bound
2	Tom Bender Neahkahnie, OR	The use of a "Medium" CZE earthquake for Resilience Planning and location of essential facilities feels improper. A careful look at the quake history chart on page 156 of your study clearly shows that the next 3000 yr. XXL quake (last which was a "cluster") is 65 years "overdue", and should be used for planning as well as the smaller "Medium" size quakes.	The Oregon Resilience Plan uses the impact of a " planning purposes because this was judged the m 43, <u>http://www.oregongeology.org/pubs/sp/p-SP</u> Oregon Building Code to limit new construction of a scenario similar to the "Medium" case.
3	Tom Bender Neahkahnie, OR	Neahkahnie is not included in unincorporated communities, and is shown as "grey" and not rated on most maps.	Of the unincorporated communities in Tillamook of together, and Neskowin are addressed directly an selected based on their population size and densit potential loss from natural hazards relative to the
4	Tom Bender Neahkahnie, OR	Essential facilities not shown on maps: Wheeler - skilled care center, clinic, pharmacy; Nehalem - NCRD evacuation center; Manzanita - Adventist Health, evac. center?; Falcon Cove - Fire Mountain School/evac. center.	Hospitals, schools, fire stations, police stations, er essential facilities included in this analysis. That se individual jurisdictions.
5	Tom Bender Neahkahnie, OR	The new Nehalem City Hall is located in tsunami inundation zone and flood zone. Although floor level is above current outdated "flood zone", its access is blocked every year by street flooding.	Thank you for this information.
6	Tom Bender Neahkahnie, OR	 HAZARDS NOT ADDRESSED: Wildfires can also be caused by beach fires being reignited by late afternoon winds. At least 4 have occurred in the last 50-60 years in Neahkahnie, the last setting four homes on fire, the previous one luckily being blown north of residences. Another, after the one affecting 4 homes, was narrowly avoided when improper procedures by ODF intentionally burning beach wood almost caused another fire when the "wind changed". "Blue clay" impervious soils from volcanic ash deposits on existing slopes increases landslide hazards. Ground level drop after quake, ocean-rising, more storm severity impacts not addressed. 	 The Wildfire section notes that according to t recreation is the leading cause of wildfires in Plan and the CWPP. Geology at a statewide scale which may or man has recently received funding approval from F study will address issues like this at a fine scal approximately the next two to three years. Coastal subsidence is addressed briefly in the Erosion section. Increased impacts from coast
7	Tom Bender Neahkahnie, OR	 MITIGATION ACTIONS: Install solar PVs on emergency facilities, hospitals, fire stations, cow barns Set up for heat at emergency facilities, potentially needed for months without power. Similarly, what about food at emergency facilities? Nehalem, for example could tie NCRD Evac Center with the new grade school with cafeteria, which could cycle emergency food storage. Seismic upgrades at emergency facilities have not been adequately addressed or implemented. Where have "Tsunami Zone" signs on roads been updated or not updated for XXL quakes and tsunami inundation? Develop access plans for military "bridges" to reestablish road access as soon as possible and long before permanent replacement bridges could occur. Develop debris management plans. Wood-chipping for electric generation, separation of recyclable materials and those with toxic burning potential; tagging of buildings with asbestos and other hazardous materials that need to be avoided until proper treatment. Local stockpiling of water mains, utility poles and transformers, etc. to allow more rapid repairs. 	Thank you for these ideas. The jurisdictions chose for implementation over the five-year life of the P

bduction Zone (CSZ) event with a "moment magnitude" (M or Mw) of large earthquakes than the Richter scale which is often used for nitude measures the energy released by an earthquake. Most people ing intensity is measured by the Modified Mercalli (MM) scale. It is ather than an earthquake measurement, XXL (extra, extra large) is one undation expected from various CSZ event scenarios. The XXL line is dary.

Medium" Cascadia Subduction Zone (CSZ) earthquake and tsunami for ost likely CSZ event. (For explanation see DOGAMI Special Paper <u>-43.htm</u>.) The current regulatory tsunami inundation used by the f critical, essential, large occupancy, and hazardous facilities also uses

		 Emergency power supply for water pumping to storage facilities drained by broken water mains. Mapping shutoffs for water service, etc. to allow most rapid phasing of repair and resupply. Similarly, distributed location of water shut-off wrenches to shut off lines to damaged homes so mains can supply remaining ones. Nehalem Bay State Park continues, after 9 years, to post fraudulent "Evacuation Route" signs, though there is almost no possibility that any of 1500 visitors at a time could escape by those routes even if drivable. They continue to ignore signing of walkable escape routes to the high eastern parts of the park. Mitigation action: implement on-foot escape routes. Another mitigation action is that "danger trees" growing at 30 - 45 degree angles out over Hwy 101 and other important roads can be removed BEFORE storms causing them to fall. Logging impacts on streams, flooding, landslides are not addressed, nor banning logging in areas with potential landslide impact on communities. An important mitigation action not addressed for earthquakes and landslides is to prohibit additional construction in those impact areas, and to bring additional land outside impact zones into "buildable lands" category. The "value added" from such upzoning can be captured as is done in other jurisdictions, to pay for infrastructure serving those new areas, payments to development-banned properties, etc. Another major issue not discussed is whether to ban rebuilding in Inundation Zone after the Big One. Seaview WA - Sou'wester Lodge is an example where building is not allowed out to the beach. Sendai, Japan, had rocks in place 300 years ago saying "do not build beyond this point because of tsunamis". Obviously ignored, causing major losses from Fukushima quake. 	
8	Guy Sievert Neskowin, OR	I worry that the county's plan stops at Neskowin's south beachUS101 is a major landslide risk.	The Draft Risk Assessment covers all of Tillamook Landslide susceptibility map shows high and very Neskowin and along US 101.
9	Tilda Jones Tillamook Bay Flood Improvement District	Southern Flow Corridor Project (a public flood and environmental safety project) described on pages 105-106 rewritten (Rachael?) to be more factual, accurately described, and updated.	This section was reviewed and revised as requested
10	John Coopersmith Pete Anderson Realty Manzanita, OR	 Residential Seismic Upgrading could be a cost effective method to preserve or minimize housing loss after a catastrophic earthquake. On the Oregon Construction Contractors Board website there is a page discussing Residential Seismic Upgrades. The information indicates a cost of between \$4000 and \$10,000 for an average upgrade. At the \$7,000 mid-point, for a \$10 million investment over 1400 could be seismically retrofitted. To preserve the state's capital investment these could be a part-grant part-loan to home owners. Loans could be in the form of perhaps 1% interest with no payments but due on sale of the property. The loan would be recorded as a lien on the property. In this way, over time, the capital investment would return to the state replenishing the fund thus allowing for more retro-fits. If the state would fund this at \$10 million per year over 10 years with loans being paid back a substantial fund would be 	Thank you for this suggestion. We will follow-up v
